

# **Using Max For Live Wrappers with Custom Plugin Locations**

This guide walks you through the steps to edit a custom Max For Live wrapper to work with plugins in custom install locations.

It is highly recommended to install plugins in their default location when using wrappers to minimise issues and I cannot offer any support for issues caused by using plugins installed in custom locations.

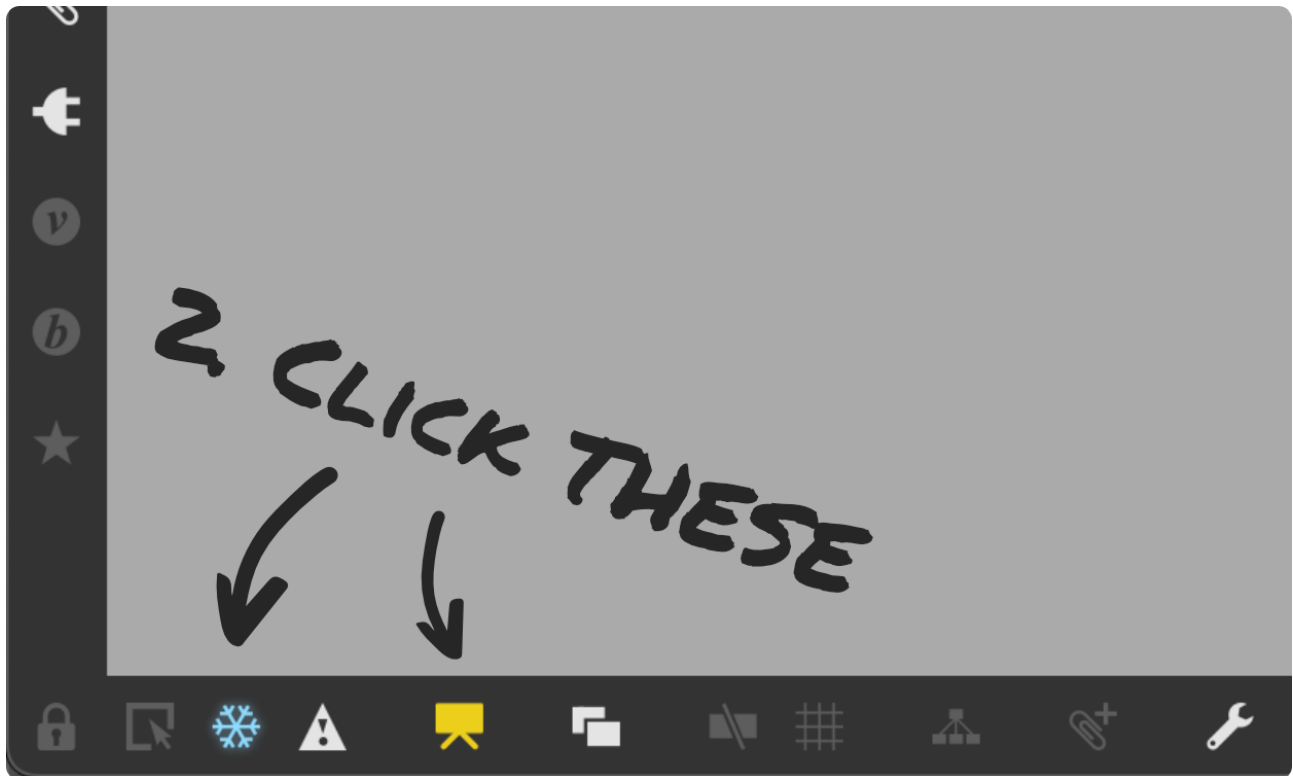

## Step 1

First, load the .amxd file into Live, then click the Max For Live icon to open the Max editor.

## Step 2

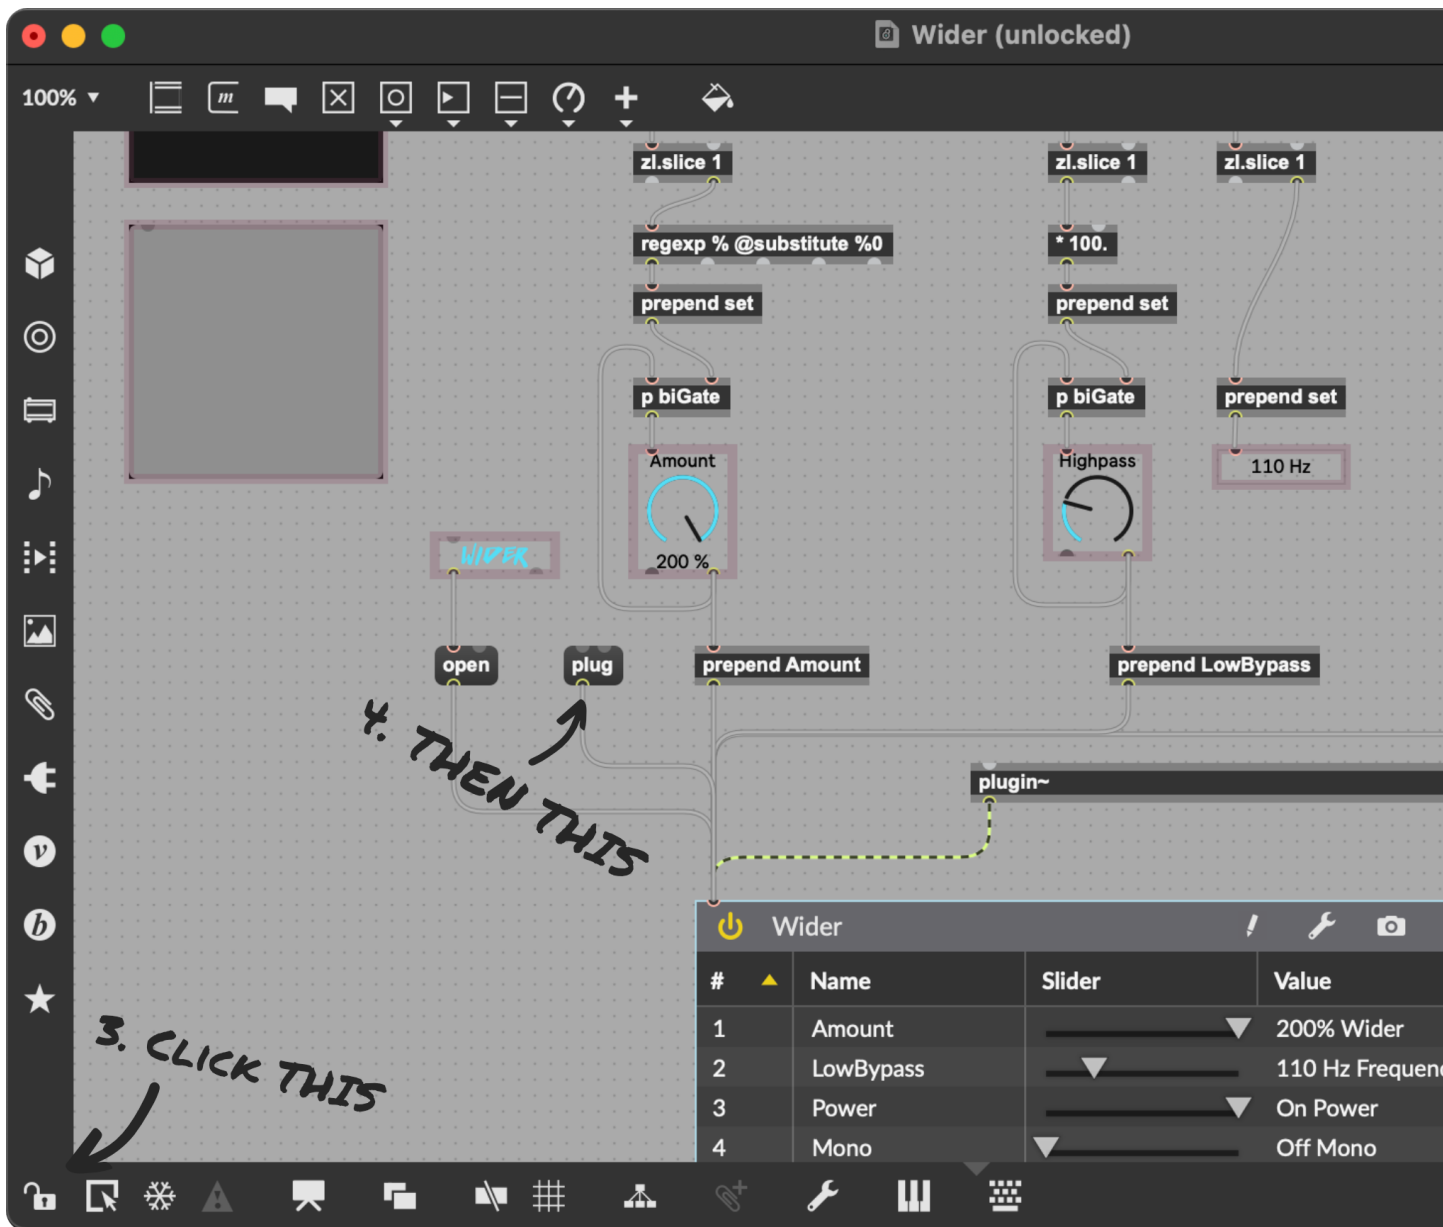

Once the Max Editor has opened click the Unfreeze and Presentation Mode icons in the bottom left.

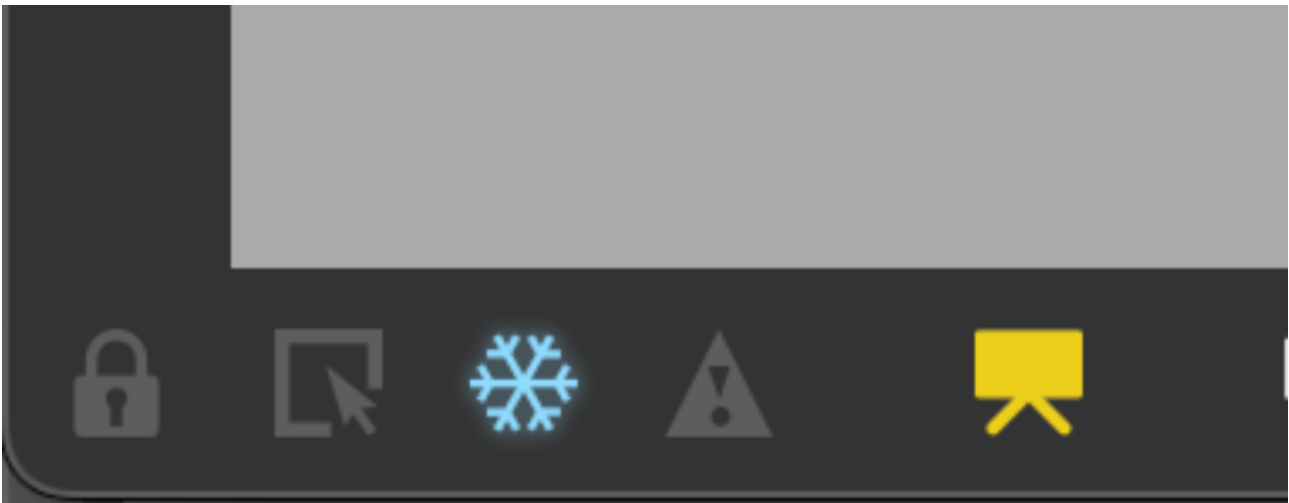

## Step 3 & 4

Click the Lock icon in the bottom left (make sure its locked), then find the little box that says 'plug' and click that. This will open your system's file browser where you can navigate to the plugin file.

Make sure you select the correct plugin format for the wrapper version you're using (AU, VST, VST3).

## Step 5

Finally, click the Lock icon, the Presentation Mode icon and the Freeze Icon again (so they look like the image above), then File → Save and close the Max Editor.

This is now a custom version of the wrapper (the original .amxd file) that has your custom location stored within the device. Use this as you would any other Max For Live device.

I'd recommend making a backup of the .amxd file. If you ever need to reinstall or change the plugin's installed location you'll need to repeat these steps.
